

EARLI

Early Autism Risk
Longitudinal Investigation

What is the EARLI Study?

The Early Autism Risk Longitudinal Investigation (**EARLI**) Study is a national research study of risk factors for having another child with autism in families already affected by the disorder. It will identify possible causes, which could be genetic, environmental or a combination of both. Information will be collected regularly from the mother during the study, and the new child will receive free developmental assessments until 3 years of age.

Who can be in the EARLI Study?

EARLI is looking for biological mothers of a child with an Autism Spectrum Disorder (ASD) diagnosis who:

- Live in Baltimore City, Anne Arundel, Baltimore, Carroll, Cecil, Harford, Howard, Montgomery or Prince George's Counties, or within a 2 hour drive of Baltimore City

AND

- Are less than 28 weeks pregnant or may become pregnant in the future.
